AMENDMENTS TO THE SPECIFICATION:

**Page 1, amend paragraph [0001] as:**

[0001] The present invention relates to an electrical switching device, and more particularly to the electrical switching device ~~to allow~~ which allows the user to switch the electrical flow without dismantling the electronic device.

**Page 1, amend paragraph [0002] as:**

[0002] A conventional electronic device has a terminal block to control the direction of electrical flow or signal so as to change the operating manner of the electronic device. With the fast speed of electronics development, electronic devices become more and more complex and compact. Thus, available space is less and less than ever. As a consequence of available space becoming less in the modern electronic devices, the built-in wiring inside the electronic devices ~~[[are]]~~ is extremely complex and complicated. Therefore, when doing maintenance or repairing ~~[[of]]~~ for the electronic devices, a user, without proper knowledge of how the built-in wiring is constructed, often damages the electronic devices and sometimes hurt himself or herself.

**Page 1, amend paragraph [0003] as:**

[0003] Therefore, how should the users properly do the maintenance or repairing ~~[[of]]~~ for electronic devices without damaging the electronic devices becomes the primary objective of the present invention.

**Page 2, amend paragraph [0006] as:**

[0006] Another objective of the invention is to provide an ~~that the~~ electrical switching device that has multiple conducting tubes each with a height different from the others and multiple conducting plates each with multiple holes corresponding to some of the conducting tubes that pass through the conducting plates and screw holes corresponding to the rest of the conducting tubes that electrically connected to the conducting plates such that the conducting tubes are categorized into different groups each electrically connected to a corresponding one of the conducting plates to allow the user to easily change the electrical flow.

**Page 3, amend paragraph [0015] as:**

[0015] With reference to Figures 1 and 1A, the conducting tubes 20 are orthogonal to the top face of the base 10 and each has an insulating layer 50 mounted outside the conducting tube 20. The conducting tubes 20 are classified into a first group 201, a second group 202, a third group 203 and a fourth group 204 each having a unique height different from the other groups.

**Page 3, amend paragraph [0016] as:**

[0016] The conducting plates 30 are also categorized ~~categorize~~ into a first conducting plate 301, a second conducting plate 302, a third conducting plate 303, and a fourth conducting plate 304. Each of the conducting plates 301, 302, 303, 304 has holes 31 corresponding to the second, the third and the fourth, the first, the third and the fourth, the first, the second and the fourth and the first, the second and the third groups of the

conducting tubes 20 and screw holes 32 corresponding to the first, the second, the third and the fourth groups of the conducting tubes 20. The input wires 70 are electrically connected to the first, second, third, and fourth groups of conducting tubes 20 and the output wires 80 are electrically connected to the first, second, third, and fourth groups of conducting tubes 20.

**Pages 3-4, amend paragraph [0017] as:**

[0017] With reference to Figures 1-5, when the electrical switching device is to be assembled, the second, third and fourth groups of conducting tubes 20 extend through the holes 31 of the first conducting plate 301 and the first group 201 of conducting tubes 20 abuts bottom faces of the screw holes 32. Screws 40 are threadingly extended into the threaded free ends of the first group 201 of conducting tubes 20 to secure the engagement between the first conducting plate 301 and the first group 201 of conducting tubes 20. In order to prevent unwanted electrical connection between the conducting tubes 20 and the conducting plates 30, an insulating plate 60 is securely attached to a bottom face of each of the first conducting ~~plate~~ plates 301.

**Page 4, amend paragraph [0018] as:**

[0018] Then the ~~first~~, third and fourth groups of conducting tubes 20 extend through the holes 31 of the second conducting plate 302 and the second group 202 of conducting tubes 20 abuts bottom faces of the screw holes 32. Screws 40 are threadingly extended into the threaded free ends of the ~~[[first]]~~ second group 202 of conducting tubes 20 to secure the engagement between the second conducting plate 302 and the second group 202 of conducting tubes 20. In order to prevent unwanted electrical connection between

the conducting tubes 20 and the conducting plates 30, an insulating plate 60 is securely attached to a bottom face of each of the second conducting ~~plate~~ plates 302.

**Page 4, amend paragraph [0019] as:**

[0019] The ~~first, second and fourth group groups~~ of conducting tubes 20 ~~extend~~ extends through the holes 31 of the third conducting plate 303 and the third group 203 of conducting tubes 20 abuts bottom faces of the screw holes 32. Screws 40 are threadingly extended into the threaded free ends of the third group 203 of conducting tubes 20 to secure the engagement between the third conducting plate 302 and the third group 203 of conducting tubes 20. In order to prevent unwanted electrical connection between the conducting tubes 20 and the conducting plates 30, an insulating plate 60 is securely attached to a bottom face of each of the third conducting ~~plates 30~~ plate 303.

**Pages 4-5, amend paragraph [0020] as:**

[0020] Thereafter, the fourth group of conducting tubes 20 abuts bottom faces of the screw holes 32. Screws 40 are threadingly extended into the threaded free ends of the fourth group 204 of conducting tubes 20 to secure the engagement between the fourth conducting plate 304 and the fourth group 204 of conducting tubes 20. In order to prevent unwanted electrical connection between the conducting tubes 20 and the conducting plates 30, an insulating plate 60 is securely attached to a bottom face of each of the fourth conducting ~~plates 30~~ plate 304.

**Page 5, amend paragraph [0021] as:**

[0021] After the aforementioned assembly, it is noted that the user is able to have

Serial Nr.: 10/815,238

04141-URL

different electrical connection between the input wires 70 and the output wires. For example, when the first group of conducting tubes 20 is employed, electricity is provided to the first input wire 701 and the electricity is transmitted to the first output wire 801. When the second group of conducting tubes 20 is employed, electricity is provided to the second input wire 702 and the electricity is transmitted to the second output wire 802. When the third group of conducting tubes 20 is employed, electricity is provided to the third input wire 703 and the electricity is transmitted to the third output wire 803. When the fourth group of conducting tubes 20 is employed, electricity is provided to the fourth input wire 704 and the electricity is transmitted to the fourth output wire 804. Therefore, the user is able to choose different groups to divert the electricity direction without using a jumper or a jump wire to change direction of the electricity flow.
